Ex No: 12 End to end communication at transport layer.

Aim:

To implement an echo-client server using TCP/UDP socket and implement a chat client-server using socket programming.

a) echo-client-server using TCP/UDP a socket is an endpoint used for communication b/w two service. the client sends a message to server and the server sends the same message back to client.

Procedure:

a.1. create server and client program.

2. Import the required socket library.

3. In server, ~~cb~~ creates a socket and bind it to an IP address and port O/P

4. Make the server wait to client request

5. Start client and connect to server

6. Enter message from client

7. Send MSS to server

8. The server receives the MSg and sends same message back.

9. The client receives and display the echo/ack.

10. Close socket connection.

#

b. Client Server using socket program.

1. Create server and client program using socket programming.
2. Start server and bind it to an IP address and port.
3. Make server wait for client communication
4. Start client and connect it to server.
5. Enter MSS in client.
6. Send MSS to server
7. The server receives and display MSS.
8. The server sends a reply back to client.
9. Continue sending and receiving MSS to perform a chat.
10. Close the connection after the chart is completed.

Result:

The end to end communication was successfully implemented using TCP/UDP sockets.
