Ex.No:14 Raw Sockets - Packet Sniffing

Aim:

To write a program using RAW sockets to implement packet sniffing.

Theory:

A packet sniffer is a program used to capture and examine network packets travelling through a network interface. A raw socket allows program to access network packets directly at low level, so Packet Information such as source address, destination address.

Requirement:

Computer / Laptop

Python

RAW Socket Support

Network interface

administrator / Root Privileges

Algorithm:

1. Start the program
2. Create RAW Socket
3. Find the socket to required actors interface.
4. Wait for incoming network Packets
5. Capture the packet using RAW socket.
6. Extract Packet Information.

7. Display packet detail
8. Stop program when required.

Procedure:

1. Open python IDE or terminal
2. Create a python program for packet sniffing.
3. Import Socket module
4. Create RAW Socket
5. Use recvfrom() fun to receive packets.
6. Read captured Packet data
7. Display Packet information
8. Generate some network traffic and observe the captured Packets.

Result:

Thus a RAW Socket based packet sniffing program was implemented successfully.
